Supplementary Materials

Fixed-Width vs. Multiprecision Digit Generation
for JSON Canonicalization: A Four-Algorithm Empirical Study

Mark Lenhardt
Lattice Substrate

March 6, 2026

This document contains the complete benchmark tables and statistical comparisons referenced as "supplementary materials" in the main paper. All data are auto-generated from raw benchmark output by `scripts/generate-paper-tables.go` and are reproducible from the archived artifact (DOI: 10.5281/zenodo.18890835).

Contents

1 Full API Benchmark Results **2**

2 Full CLI Benchmark Results **18**

3 Full Statistical Comparisons **32**

1 Full API Benchmark Results

Table 1 reports the complete API benchmark results for all 16 comparison pairs across all workloads and modes (canonicalize and verify). Each row reports the mean of n=10 iterations. Allocation columns (Δallocs/op, ΔB/op) report the difference between the two implementations in each pair; negative values indicate the first implementation allocates less.

For Rust implementations, allocation data is measured via a counting global allocator (`std::alloc::GlobalAlloc`) that intercepts all heap allocations.

Table 1: API benchmark results (mean of $n = 10$ iterations).

Pair	Workload	Mode	ns/op		Speedup	Δallocs/op	ΔB/op
go:schubfach-vs-bd	array-2048	canonicalize	2546877	4136393	1.62×	+8210	+186633

B/op = bytes allocated per operation. allocs/op = heap allocations per operation.
Δ columns show Impl B − Impl A for each pair.

2 Full CLI Benchmark Results

Table 2 reports the complete CLI benchmark results for all 16 comparison pairs across all workloads and modes. Each row reports the mean wall time of n=15 repetitions (3 warmup discarded). Task order was randomized with a fixed seed.

Table 2: CLI benchmark results (end-to-end, $n = 15$).

Speedup = slower/faster mean wall time. $n = 15$ repetitions, 3 warmup runs discarded.

3 Full Statistical Comparisons

Table 3 reports all 1,644 statistical comparisons across 16 pairs, 3 tracks (API, CLI end-to-end, CLI algorithmic), 2 modes (canonicalize, verify), and all workloads. Each comparison includes:

- **Speedup:** ratio of slower to faster mean.
- **$\mathbf{CI}_{95}$:** BCa bootstrap 95% confidence interval on the speedup ratio (5,000 resamples).
- **p:** raw permutation test p-value (5,000 resamples).
- **$p_{\mathbf{adj}}$:** Benjamini–Hochberg adjusted p-value controlling false discovery rate at $q = 0.05$ across all 1,644 comparisons.
- **d:** Cohen's d effect size ($(\bar{x}_A - \bar{x}_B)/s_p$; negative = implementation A faster).
- **Noise:** standard deviation of the faster implementation, quantifying measurement noise in the same units as the metric.
- **MDE:** minimum detectable effect at 80% power, expressed as a percentage of the faster implementation's mean.

p-values at the resolution floor of $1/(R+1) = 0.0002$ (where $R = 5{,}000$ resamples) should be interpreted as $p < 0.0002$.

Table 3: Statistical comparisons with Benjamini-Hochberg corrected p-values.

*Significant after Benjamini-Hochberg FDR correction at $q = 0.05$.
d = Cohen's d: $(\bar{x}_A - \bar{x}_B)/s_p$; negative = impl A faster. Track: e2e = end-to-end CLI.
Noise = CV × mean of faster impl. MDE = minimum detectable effect at 80% power (z-approx).
Rust allocs/op and B/op measured via counting global allocator (§).
